

US-4 depends on US-21 as to know which User is logged into the session, and if that User is a department representative for a group, if the User is a department representative, then they'll be allowed to post announcements for that group.

US-23 depends on US-21 to add the Official tag to Club Pages, when creating a club, it needs to know the e-mail or the role of the user creating to club to determine if this is an official club or not.

US-12 depends on US-11, because replying to comments functionality is similar to just commenting posts. And also posts store comments, which store replies, so logically I should implement creating comments to the post first, and only then do the replies functionality

US-11 depends on US-21, because we should see the post author in the comment

Anything related to the Current User in the web application is currently hardcoded as its implementation was the last one completed.
